# A GUIDE TO THE LITERATURE AND DISTRIBUTIONS OF THE MARINE ALGAE OF THE PACIFIC COAST OF NORTH AMERICA

By

E. YALE DAWSON

---

## INTRODUCTION

More than two decades have elapsed since the monographs by Setchell and Gardner of the Chlorophyceae and Phaeophyceae brought our knowledge of these groups of marine algae on the Pacific Coast of North America up to date for 1920 and 1925, respectively. Although these works are still highly authoritative and moderately complete, a considerable number of papers dealing with the green and brown algae of our coasts have subsequently appeared, creating changes and additions in these classes. The status of the Rhodophyceae, moreover, has long been unsatisfactory, for no assembly of the literature dealing with Pacific Coast species, nor complete survey of the species, has ever been accomplished. The existing information is badly scattered and largely inaccessible except to those few who have access to a large library and to collections such as those of the University of California. Aiming toward alleviating this situation, an attempt has been made to assemble here the published records of determinations and distributions of all the marine algae of the Pacific Coast of North America, with the exception of the Myxophyceae.

The appearance of three important works within the past year, each dealing with the algal flora of a different part of the Pacific Coast, has made this task immeasurably easier and more practicable. Smith's *Marine Algae of the Monterey Peninsula, California*, in treating of a large proportion of the species occurring on the Pacific Coast of the United States, has been of signal value in bringing together a great amount of information on these northern plants. The author's monograph of the *Marine Algae of*

*the Gulf of California* has brought that region up to date such that no further assembly nor review of its literature was necessary. The valuable work of Taylor: *Pacific Marine Algae of the Allan Hancock Expeditions to the Galapagos Islands* has provided abundant information on the algal floras of the Mexican and Central American coasts of which almost nothing was previously known.

Citation of all the references to any given species has not been possible, but the references cited include the most recent ones and will serve in each case as a key to the previous literature.

The limits of the "Pacific Coast of North America" are taken as the Aleutian Islands on the north and the Gulf of Panamá on the south. The coastwise distance between Attu Island and Panamá is nearly 6500 miles. For the sake of consistency, distribution records are cited from north to south.

La Jolla, California,

June 30, 1945.
